Support export to the following databases: DB2, FoxPro, KDV, Marvel, MicroSoft SQL Server, Paradox, Sybase, WinBase, ODBC. Unzip Paradox database Why is my Paradox database unzip as zip file? Unzip Paradox database The Paradox application is not very sensitive to the way databases are created, mainly because the data and the structures are divided into separate files. Therefore, it is possible that, if your database is created as a zip archive, the Paradox application will not unzip it correctly. If this is the case, try using the unzip command line tool instead to unzip it properly. We recommend that you download and install the free version of WinRAR (free) in order to open and extract the Paradox database. The package includes the free WinRAR version and also some other applications. What is an archive format? An archive is a type of file for storing data which has been put together in a certain way. The file is simply a package which can be opened and read. So far, ZIP file archive is the most widespread. The Paradox database format is used by Paradox itself, but not by the main companies that create applications that work with Paradox databases. Archive formats are becoming common, because the data files of the database are distributed across various files. This makes it easier to work with and handle the files. New York City PD, a branch of the US Department of Justice and a unit of the NYPD are examining the possible involvement of New York's congresswomen in a "plot" in an alleged assassination of the FBI agent. PDX Viewer Plus Description: This multifunctional software program can be used both as a stand-alone app and as a cloud-based tool. Q: Handle unique id in Javascript I have a unique id as shown below. var myUniqueID = "My unique id..."; var id_count = 0; function new_site_design_solution_project() { id_count += 1; var my_uniqueID = "MyUniqueID" + id_count; } How can I add two javascript in one button and get different unique ids? A: You can use a counter within a closure to create a unique id. The reason is that when your function is called in the HTML-element it is not executed in the global scope but in the scope of the HTML element. The counter is incremented with every call of the function so each time you create a unique ID. If you want to have something like this: var previous = new Array(); // assuming you have already defined an id for the element myElement.id = "ID_" + previous.pop(); function doSomethingWithJavascript(myElement) { // for example, you could use the id alert(myElement.id); // alternatively you could access the DOM alert(myElement.getElementById("ID_" + previous.pop())); } Then call your function like this: doSomethingWithJavascript(myElement); Q: Can I use Azure AD users to authenticate a .NET Core 2.0 project
