file, Report file and Font file). It is also possible to add your own symbols to the Sample project. 2. Open the Sample project and change the path of the data files (metaStock\_db.mdd and metaStock.mdd) accordingly on your computer. Also, change the database name (db 09e8f5149f

**USAGE SUMMARY** Create a new MetaStockData object and load data from the server initMetaLib(String pathToMetastockDatas), where pathToMetastockDatas is the file path to the MetaStock data. Use the DownloadQuotes function to download intraday/end of day quotes The metaLib::DownloadQuotes() function can be used to download the quotes that you want. There is a two-way communication between the server and metaLib. Take in your mind that metaLib uses an asynchronous method and does not wait for a result from server, just like a web crawler does. That means, if the quote requested is not available from the server, metaLib will try to request another one, until it gets a result. When a quote is available from the server, metaLib will pause the main loop, as if it received the answer, and then is ready to parse the downloaded data. "Data parsing" means to parse downloaded intraday data into MetaStock data objects. Each of them can be read using the GetQuote() function (the list of the available data classes is at the end of this document). Note that the server can provide historical data as well (data from 2003/2004). The DownloadQuotes function is able to request intraday/end of day historical data as well. You should always try to request a historical quote before a fresh one. If you try to request a fresh quote, it will be stored in the metaLib object, and will be available to you using GetQuote() (where MetaStockData or MetaQuote is your class), but the intraday/end of day historical quote will be not be available. The metaLib::DownloadQuotes(String\* quote) function can be used to download intraday/end of day quotes. It takes a string pointer to a string, where the server will write the downloaded quote. If you do not want to have the quote in a string, you can delete it before the metaLib object (where the quotation will be stored as MetaStockData or MetaQuote) and it will not be available any more. You should always try to request a historical quote before a fresh one. If you try to request a fresh quote, it will be stored in the metaLib object
