When you open Photoshop, it displays a welcome screen; you can customize this screen by clicking the Info button in the upper-left corner of the screen (Figure 1.2). There are options to customize the way Photoshop displays menus and file names, and you can display a scale bar to help you measure and select appropriate file sizes. Figure 1.2. The welcome screen displays options that you can customize. In addition to the Welcome screen you can customize a number of settings by clicking the Preferences button on the top of the Photoshop workspace, or by right-clicking a dialog box. These settings include the following: **Application window settings:** The number of files you can have open

simultaneously in Photoshop, the standard file size, the Application window display options, Window position, and Window Size. You can customize all of these settings by clicking the drop-down menus and adjusting the settings. **Windows settings:** These settings are similar to the application window settings. If you have a Mac, you can change the screen saver settings and display or hide the trash can. **Preferences settings:** This section allows you to change the default Photoshop dialog box options, such as column widths and order.

Q: How to prove that $\sum _{n=2}^\infty \left(1-\frac{1}{n} \right)^n$ is divergent? I know how to prove the convergence of $\sum _{n=2}^\infty \left(1-\frac{1}{n} \right)^n$. But, how to show that $$\sum _{n=2}^\infty \left(1-\frac{1}{n} \right)^n$$ is divergent? A: Consider $a_n=a_{n-1}\left(1-\frac{1}{n}\right)$ with $a_0=1$ and $$a_n=\frac{2}{n-2+\frac{1}{n}}=\frac{n+1}{n^2-2n+1}$$

for business rules, technology re-architecting, or database growth you need to budget for a year or more. Without a plan, it's very likely your database will continue to grow, making it even harder to scale or even add new features in the future. 2. Create a Database Backup Plan No matter how diligent you are, database downtime happens. So it's vital that you plan for this inevitability. If you get hit by a storm or some other emergency, you can't afford to have all of your work on a crucial database be lost. A database backup plan is essential for any business that has their main database (or data) housed in the cloud. Fortunately, the Automic DataGrip cloud-based database application has such a feature built in. Here is a basic plan for you to follow: Backup regularly. Backup frequently enough that

you can restore the database to the most recent version in a fraction of the time it takes to restore a full version of the database. Backup to multiple locations. If a storm hits your location, you'll want multiple copies of your database (your offsite locations or redundant local data centers). Backup to the cloud. Ideally, you'll back up your data to S3 or Azure, and if you're using a service such as Amazon S3 or Google Cloud Storage, these services are very reliable and powerful. The cloud-based data is secure and can be automatically restored within a matter of minutes, so you don't have to worry about losing your data if an emergency occurs. Bonus tip: Create a snapshot of your database regularly so that you can restore your database to a previous version when needed. 3. Use a Backup Restorer Many vendors make it easy to switch database backups to a cloud data source. In Automic DataGrip, there's an application called the Data Restore Application. This feature has built-in functionality to restore snapshots to data stored in S3 or Azure. Using the Data Restore Application is easy – you'll simply choose the location of the data in the cloud, and Automic DataGrip will automatically restore the data in the backup to the cloud. 4. Develop Dependencies If you're familiar with test & integration tools, you know how important it is to specify project dependencies. Have
