Photo-editing Programs Available In addition to Photoshop, there are many other image-editing programs that you can use to refine your photos. Some are free, and some cost money. Here is a list of the software programs available: • Adobe Photoshop Elements is a good, affordable program with extensive features, including undo support and a choice of several features for editing. It allows you to make adjustments to almost any part of the image, and it can also be used for special effects. You can also make bookmarks and create layers. The interface is fairly simple but powerful enough to satisfy the needs of most beginning photographers. It's available in a $99 version that requires a serial number and a $199 version that doesn't have a serial number. You can also get a free trial version of Adobe Photoshop Elements. • Microsoft's Expression Media Studio is an advanced photo-editing program that contains numerous advanced editing features. Many features of Expression Media Studio are like those found in Adobe Photoshop Elements. The cost for the program is $249, and it has a serial number. For more information about Expression Media Studio, visit `www.adobe.com/products/elements-suite.html`. • Snapfish creates pictures that are similar to those you can get from a camera when you upload your pictures to the website, and they allow you to perform basic editing. There is a free version of Snapfish with no editing features. There is a $24.95 per month fee for a premium version of Snapfish that allows you to upload your photos to your site or to a selected FTP site, use image corrections such as straighten, resize, rotate, enhance, de-saturate, and manipulate the brightness and contrast of the image. You can perform some basic editing, such as changing the image size, changing the canvas (the overall size of the photo) and the cropping, with the $24.95 per month subscription. • PaintShop Pro is a program created by Corel. It is a fully featured photo-editing program, and it is very expensive. However, PaintShop Pro offers the features of Photoshop, plus a much more powerful user interface. Plus, you can find online tutorials on how to use it. Although not as friendly as Photoshop, PaintShop Pro has many features like those found in Photoshop Elements. The cost for

Short Message Service (SMS) is a telecommunications service that allows users to send and receive short text messages or short messages, typically of 160 characters. Short Message Service (SMS) messages are similar to paging messages in that they are typically delivered to and from a device after the device's user has either actively initiated reception of the message or has chosen to view the short message. More specifically, conventional SMS is a service that allows users to exchange short text messages via mobile phones. The most widely used SMS is based on the IS-41 standard which allows up to 160 characters to be sent. Because of the short format of an SMS message, users require a limited amount of interaction with the service, e.g., an SMS message may not be sent if a phone number is unknown. Thus, SMS is a very efficient service for one-way (point-to-point) text message delivery. As understood, SMS is different from Text messaging (also referred to as "Chat messaging"). More information on SMS can be obtained at www.smpproject.org. Short Messaging System (SMS) messages have long been limited to 160 characters. It is believed that the lack of a desire to send a greater length of text has been the reason that message length has not been increased. This limited length has been due to the requirement that the size of the memory in a mobile phone be relatively small. One area that has not been fully explored is the use of SMS to generate large quantities of traffic. For example, a short text message could be used as a vehicle to obtain a temporary list of phone numbers associated with a group of phone numbers. The numbers in the group are then programmed as "recipients" of the text message and would be sent to the phone number associated with the group when the message is retrieved. The message can be optionally be encrypted and/or stored temporarily, e.g., on a server, in such a way that anyone who knows the phone number of a member of the group can retrieve the message. Optionally, a password can be required to obtain the message. It is believed that the above-mentioned system and others (e.g., pager protocols such as MNP and SIMPLE) lack sufficient security to prevent use by people not associated with the group. Another area that has not been fully explored is the use of SMS to distribute information. For example, a short text message could be used to deliver a listing of all employee phone numbers
