Working with digital files Digital files are typically saved in the .jpg format. This means that in a typical digital photograph, the image appears as though it is black-and-white. The colors in an image come from the color information included in the photo. Before the file is processed, the colors in the image are stored as text data. The colors are stored from top to bottom on the page, left to right. The spaces between the lines where the picture data is stored are known as lines. Each line corresponds to one color, and the lines are stored from top to bottom, left to right. The lines are actually integers that represent the color information. The height of the line is the color depth. The most common color depth is 4 bits, which means 4 binary digits. If you were to look at the lines in a Digital Negative (DNG) file, which is the raw format of a digital picture, you would see 10 lines per page, which is 4 bits of color depth. Each line is then divided into individual pixels. Each pixel is a point on a line. The vertical position of a pixel is known

Pen tools are an easy way to create bezier lines and circles in Photoshop. You can even zoom in and out to create intricate designs. Create a PDF is a fast and easy way to create and export a layered PDF file. Glyphs, or glyphs, are the shapes used to represent letters of a language. How do you create and modify your own fonts? How do you use them in your work? And what are you using them for? What are Fonts? The term "font" is used in many different ways, including; Web Fonts - These are the fonts that can be used for web pages. Web fonts are small sets of vector image files. They are made to fit many different resolutions and they load quickly. Photoshop Fonts - These fonts can be used for any purpose in Photoshop, including for use in graphics and web pages. Photoshop fonts come in two different file formats. TrueType fonts are essentially vector image files that can be used in designs that will be printed. Web Fonts are true type fonts. What really makes them different is that the web versions are compressed. This makes them smaller and lighter. They're much easier to handle and load. DTP Fonts - These are fonts used in desktop publishing. They are similar to Photoshop fonts, but they are typically much larger in file size and require much more processing power. You don't have access to Photoshop tools for them. Print Fonts - This is a type of font specifically designed for printing. You can use them for web and desktop publishing. There are many different typefaces available for print. Create Your Own Font If you don't use Photoshop, you can use online sites like FontSquirrel ([www.fontsquirrel.com](http://www.fontsquirrel.com)) to create your own fonts. Once you find a font you like, you can use the Generate Font button to create a similar looking font. New layers don't work right away. Before you can use a new layer you need to open the Layer dialog box (seen below) to create a new layer. You can do this by clicking on the (i) icon that's on the layer thumbnail. You'll need to have the previous layers still visible so you can combine them. How do you create layers? You can create new layers. New layers don't appear on the screen. But to do something that will appear on the screen you need to create a new

I would like to show that the number of edges in  $G$  is at least  $k+2$ . The most naive way I could think about would be to show that  $G$  has a path  $P$  of length  $4$  such that at most  $k$  edges of  $P$  have no internal vertex in common with  $P$ . But I don't know if I can do better. A: Here's a construction: Let  $k \geq 3$ . Take two disjoint copies of  $K_{k+1}$ . Tie together the two copies with an edge between them. The graph is a  $K_{k+1}$  (girth  $k+1$ ) that has been replaced at one end by two smaller copies of itself (girth  $k+3$ ). This change makes the edge between the copies  $k+2$  because it did not have any before. Added: (See the comments below.) Here's another  $K_{k+1}$  version that has girth  $k+4$  but fewer edges (and has the same diameter as your example): Take two disjoint copies of  $K_{k+1}$ , and tie together their center  $v$  with a path  $P$  of length  $k+1$  that starts from  $v$ , and ends at the other two centers  $w_1$  and  $w_2$ . The number of edges is  $k+2$  because  $P$  has  $k+1$  edges (so one edge each from  $v$  to  $w_1$  and  $w_2$
