Mobi Info Edit Full Version

MobilInfoPlus is a Mac iPhone Android Application which is designed for the management of Mobi and Multimedia information,. HTML editable mobile wikis with. Mobile Software Delivery - Mobi SDK. EeContent Mobile English Standard version for Android 2.1 mvbpro v1.0.0.0_0.0.4 download1. Field of the Invention The present invention relates to a system and method for managing the configuration of a mobile telephone network, and more specifically, to a system and method for translating the configuration information of a telephone network into a format that is suitable for use with mobile switching centers, such as a wireless messaging telephone system. 2. Description of the Related Art A typical wireless messaging telephone system, such as the Wireless Efficient (WE), supports transferring messages through a mobile telephone network. A typical Mobile Services Switching Center (MSC) supports sending and receiving messages through the telephone network. Although the format of the data received from the mobile telephone network and used by the MSC can be varied depending on the type of wireless messaging telephone system, in general, the information is presented to the MSC as a list of telephone numbers. The MSC typically presents the data, in its entirety, to a Message Centre (MC) for further processing and storing. The wireless messaging telephone system may require the data to be formatted in a certain format. For example, the data representing each contact may be stored as a new record in a database table of all contacts in the wireless messaging telephone system. Each contact may contain information about the calling and called parties. This information may include the called party's number and the calling party's number. The number may be stored in a format that is known to the wireless messaging telephone system. For example, the called party's number may be in the form of an international telephone number. Additionally, the calling party's number may be stored in a format that is compatible with the wireless messaging telephone system. For example, the calling party's number may be in the form of an international telephone number. The wireless messaging telephone system may require that both the called party's number and the calling party's number be in the same format. It is often desirable to have a mobile telephone network that is interoperable with a conventional telephone network. For example, some business enterprises may wish to have two separate telephone networks. In one network, the enterprise may operate a business with a wireless messaging telephone system, and in another network, it may operate c6a93da74d
