The bottom line for me is that the Photoshop I bought 20-30 years ago isn't much of a threat to Lightroom because it should not be able to present in the form of images with user-editable layers and masks. That's not the case now. If you have a powerful PC with a very fast SSD, you can do great work editing, composing, and creating images from scratch with Photoshop, but I don't see it as a viable replacement for Lightroom. Adobe has been very slow in fixing the issues that prevent it from becoming a viable replacement for Photoshop. It's a shame. If you need the best Adobe Photoshop alternative, I suggest you invest in a powerful CPU and a fast SSD with a lot of storage. This will enable you to get far faster performance than you can get with even the best portable tethered-to-a-PC models. There are several quality-of-life improvements to side-load and make importing images from the camera and exporting them to the camera much easier than before. While it's not as easy to separate images using non-destructive techniques as it is to use automatic edits in Lightroom, the new tools handily provide some automation by default. **ABOVE:** The search bar in the Assets panel remains much faster than the one in Lightroom because there's no time spent waiting for the LR server to return results. **BELOW:** The same asset can be searched using the 'Image' button in the Assets panel, which is much faster. The modules on the right side of the window have gained a minor revamp to make them more consistent. For example, the effects panel now has layers and blending modes, but they're buried in the options panel. Finally, the content-aware tools have been updated to operate with newer image formats, including full support for DNG files in the 24-bit/48-bit format. It's gratifying to see so much attention given to the advanced digital camera processing side of things. After all, it was with this technology that Photoshop matured into its superpower status.

You can create and edit images and export them to popular image formats, such as JPG and TIFF. You can also save files in Photoshop format and work with images in various other ways. The Workflow options in Photoshop allow you to set the order of operations by layers and easily arrange photos. You can also convert, change, smooth, and sharpen (so you can work with images even more precisely). Image adjustments include crop, de-skew (make it look straight), reduce, and re-size. The Brush tool is your best weapon for retouching and applying new colors. You can use it to draw, paint, fill, lasso, or blend. You can use the Gradient tool to create special fills for your images. The Pen tool is the simplest way to do vector drawings. The Layer panel allows you to navigate and manage various layers, along with their associated tools, masks, colors, and special settings. The Gradient panel allows you to select colors throughout your image and apply a gradient to an area of your image and a specified layer. The Smudge tool allows you to affect the darkness or lightness of an area. The Dodge tool changes the midtones of a layer, allowing you to create an image with a darker or lighter overall look. The Colorize tool lets you change the colors in an image. The Spot Healing Brush tool corrects areas of an image where pixels have been duplicated or have disappeared. You can eliminate red-eye from a bright light or restore details in areas where you've accidentally applied an effect. The Clone Stamp tool, which is a sub-tool in Command, recovers lost details and parts of an image by duplicating pixels that are not covered by a selection or layer. e3d0a04c9c

"For many years Adobe had clients that generously shared work with us, but they were a minority. We've noticed over the past several years that the shift to exponentially growing platforms has accelerated the need to focus on single-person teams like ourselves while keeping in touch with our (but no longer) partner teams," said Avinash Panigrahi, CEO and co-founder of DxO. "As a result, we felt more and more compelled to bring the world of collaboration inside Photoshop. We've been working on it for several years before we decided to get it out of beta. Share for Review is the result of our mission to add more control and modularity to access the world of collaboration from inside the app. Through our work with OEMs, we've also improved our existing collaboration offerings with today's software innovations. We continue to work on adding new features and functionality across the entire experience, so we hope you're as excited as we are."
